

Barents Sea 2013 Datapack Cretaceous and Tertiary Reservoir Quality Database Upgrade

This multi-client study comprises data for twenty-four recently, or soon to be, released exploration and appraisal wells in the Norwegian Barents Sea. The study will provide additional data, supplementary to that provided in previous multi-client studies from the Norwegian Barents Sea, i.e. Stratigraphic Database and Cretaceous and Tertiary Reservoir Quality Database.

The database comprises all twenty-four wells drilled in the Barents Sea from September 2008 to January 2012, including all cored intervals in the Cretaceous and Tertiary.

Deliverables include;

- *Full stratigraphic interpretation of the succession in all wells, utilising stratigraphic schemes defined in the larger regional database study.*
- *Detailed core descriptions at 1:50 scale for the cored Cretaceous and Tertiary successions.*
- *Quantitative biostratigraphical analyses on core samples.*
- *Depositional interpretation of the entire Cretaceous and Tertiary interval matched to wireline logs in each well.*
- *Digital conventional core analysis data coded with respect to a range of parameters including formation, sequence, lithofacies, environment, grainsize and sorting.*
- *Petrographic descriptions on thin sections taken from core samples.*
- *Summary of petrographic and diagenetic controls within each reservoir unit, and comparison with the larger regional database.*
- *Updated time-slice thickness and palaeogeographic maps.*
- *Set of close-up representative core photographs illustrating various sedimentological, ichnological and tectonic/diagenetic features.*
